

Mitotic

A universal ring
that is part of you

With my background in Nursing and my passion with design, I created the Mitotic ring. It is a unique unisex ring that seamlessly blends science and aesthetic, this innovative piece draws inspiration from the intricate process of mitosis within a cell. Crafted with precision, the ring's design mirrors the elegant dance of chromosomes during cell division, featuring intertwined bands that symbolize the delicate balance of life's continuous renewal. A minimalist design and harmonious blend of elegance and scientific wonder, appeals to those who appreciate the profound connection between biology and aesthetics.

Prototypes / Resin Print

Resin printing offers high precision and fine details, making it ideal for intricate designs common in jewelry, such as patterns or small engravings.

Holding a tangible prototype provides a better understanding of the ring's aesthetics, proportions, and overall design.
